Dr Giovanni Cerulli

Editor in Chief

*International Journal of Computational Economics and Econometrics*

Dear Dr Cerulli,

Please consider the manuscript “Semiparametric Inference for Myerson Reserve Prices from Auction Maxima” for publication in the *International Journal of Computational Economics and Econometrics*.

The paper studies inference on an economically important policy functional when the latent bidder-value distribution is observed only through auction maxima. It combines a structural Wasserstein generative adversarial network with cross-fitting and a Neyman-orthogonal score. The central econometric result is that global distributional fit is insufficient for inference when the reserve depends on weakly observed local tail moments.

The manuscript makes three contributions:

- it embeds the auction order-statistic observation rule inside a bidder-level structural generator;
- it provides formal fixed-bandwidth inference for a regularised reserve under primitive local nuisance and overlap conditions; and
- it uses Monte Carlo ablations and external-validity designs to identify the local-information boundary of the method and motivate a hybrid global-generator/local-score estimator.

The paper fits the journal’s coverage of computational econometrics, Monte Carlo simulation, robustness analysis, and software implementation. Its formal fixed-bandwidth claim is kept separate from the diagnostic shrinking-bandwidth procedures for the exact reserve. The submission uses simulated data only, has no human participants, and includes a documented replication package with deterministic integrity checks and archived result files.

The review manuscript is anonymised for double-blind evaluation and includes conflicts-of-interest and AI-tool declarations. Thank you for considering the paper.

Sincerely,

Shunyu Hao
